

INCORPORATING CAMERA EFFECTS INTO
EXISTING VIDEO SEQUENCES

Abstract of the Disclosure

A system may be provided which enables pan and zoom features to be added to existing stored video. A graphical user interface may display a video sequence as a series of thumbnail size frame images. The user may then indicate on any two such thumbnail sizes images a region which may be enlarged. The software then interpolates the degree of enlargement and the position on the enlarged region between the two selected frames over any intervening frames.
